ERRATA AD-A 299 414

MEMORANDUM FOR MS. GRETCHEN SCHLAG

FROM: Tri-Service Comprehensive Oral Health Survey (TSCOHS) Lt Col Forrest R. Poindexter Naval Dental Research Institute Detachment 8901 Wisconsin Avenue Bethesda, MD 22889-5602

SUBJECT: Errata pages for TSCOHS reports: ADA 299414 and ADA 299418

Enclosed are an errata list and hard copies of corrected pages from our recent reports which I would like you to insert into the master documents in the DTIC file.

ERRATA

Recruit Report: #ADA 299414

- 1. page 4, column 2, line 13 should read "...the comparison national ..."
- 2. page 42, fig. 5.4 shading for Class 2 segment (42.5%) is poor
- 3. page 56, fig. 6.4 -
- 4. page 68, fig. 7.4 pie graph is incorrect.
- 5. page 90, column 2, next to last line should read " ... in class 3 are 0.2..."

Active Duty Report: #ADA 299418

- 1. page 44, fig. 5.4 shading for Class 2 segment (37.8%) is poor 2. page 58, fig. 6.4 " " " " (15.6%) " " 3 page 72 fig 7 4 " " " " (79.9%) " "

- 4. pages 108-111 data labels on figures and tables were mixed up. All pages need to be replaced.

If you have any questions, my phone numbers are (301) 295-4474 or DSN 295-4474. My email address is poindex@btdacr, med.navv.mil. Thanks for handling this promptly, since there have been several inquiries from parties interested in ordering the reports.

ABSTRACT (Maximum 200 words) This study explores the oral health status, dental treatment needs, dental readiness status, dental utilization, and perceived need for dental care of a random sample of 2,711 Army, Navy, Air Force and Marine recruits. Clinical measures were collected by calibrated examiners; non-clinical data were collected from individual recruits using selfadministered questionnaires. Data collection occurred between February and July 1994. Data were weighted by age, sex, and race to reflect the entire recruit population during the data collection period and were analyzed using Stata and Survey Data Analysis (SUDAAN) statistical software. Where possible, oral health outcome measures for military recruits were compared to their employed civilian cohorts. Results show that compared to civilians, military recruits have a higher proportion of decayed teeth and a lower annual dental utilization rate. Only 38.2% of military recruits have seen a dentist within the past year and 61% perceive a need for dental care. Nearly all (99.3%) recruits need some type of dental care with roughly half being in DoD dental readiness class 3. Four-fifths of military recruits require 75 or fewer composite time values of dental care. Treatment needs, dental utililization, and perceived need all vary across demographic characteristics.

ACKNOWLEDGEMENTS

We gratefully acknowledge the following recruit site project officers: COL Stephen E. Fryling (USAF), CDR John L. McGinley (USN), CDR Charles F. Tremann (USN), and CPT Gregory Morgan (USA). Without their diligent and tireless effort, this project would not have been possible. Thanks to CAPT J. Stephen Arthur (USN) for his invaluable contributions during the project planning and protocol development stages. Thanks are also due CAPT Charles Richardson (USN) for sharing his keen insight and expertise during the software development phase of the project.

Executive Summary

This report presents findings from an oral health survey of U.S. military **recruits at time of entry into the armed services**. The survey was conducted from February to June 1994. Data on oral health status, dental treatment needs, DoD dental readiness classification, dental utilization, and perceived need for dental care were utilization, and perceived need for dental care were collected on Army, Navy, Marine, and Air Force recruits at Ft. Leonard Wood, Naval Training Center Orlando, Marine Corps Recruit Depot Parris Island, and Lackland Air Force Base, respectively. Prior to analysis, the sample of 2,711 was weighted to reflect the population of military recruits for the first half of 1994 (101,072). Where possible, oral health measures on recruits were compared to identical measures on employed civilian cohorts. Key findings from this survey are summarized below:

RESULTS

Oral Health Status

- Compared to their employed civilian cohorts, military recruits have a statistically significant higher proportion of their decayed, missing, and filled index scores attributable to decay.
- Edentulism is virtually non-existent in military recruits. Excluding third molars, 87.7% of recruits have no missing teeth and only 2.3% have more than two missing teeth.
- Prevalence of soft tissue pathology in military recruits is under 5%.

<u>Treatment Needs and DoD Dental Readiness</u> <u>Classification</u>

- Nearly all (99.3%) military recruits need some type of dental care; roughly half are in DoD dental readiness class 3.
- Nearly all (96.7%) military recruits need an oral prophylaxis. Oral prophylaxis is the sole treatment need for only 6.7% of military recruits.
- Restorative care (79.3%) ranks second to oral prophylaxis as the most common area of dental treatment need for military recruits. On average, recruits with restorative needs require 4.4 restorations.
- Among military recruits in DoD dental readiness class 3, most (92%) require treatment of class 3 conditions in one or two clinical disciplines.
- Roughly 80% of military recruits require 75 or fewer composite time values (CTV) of dental care.
- Based on CTV counts, restorative and oral surgical procedures account for 58.2% of all dental treatment needs of military recruits.
- Different categories of dental treatment need, DoD dental class, and CTV counts were significantly affected by one or more of the following demographic variables: age, race, gender, and education level.

Dental Utilization

- Only 38.2% of military recruits have seen a dentist within the past year; 30% have either <u>never</u> seen a dentist or have not seen one in three or more years.
- ◆ With the exception of 18-19 year old white females, for every valid statistical comparison that could be made between military recruits and their employed civilian cohorts, military recruits have lower annual dental utilization rates than their employed civilian cohorts.
- Among recruits, there is no significant difference in dental utilization between males and females within race. Comparing across race, blacks tend to have lower annual dental utilization rates than other racial groups.
- Examinations and oral prophylaxis account for the largest categories of dental services consumed by all recruits as well as by only those recruits who have seen a dentist within the past year.
- Annual dental utilization of military recruits varies with gender, marital status, perceived need for dental care, race, education, age, DoD dental class, and region of U.S.

Perceived Need

- Sixty-one percent of military recruits perceive a need for dental care.
- No consistent pattern emerges when comparing perceived need for dental care between military recruits

and their employed civilian cohorts. Similarly no consistent pattern in perceived need for dental care exists among recruits both within and across race.

Perceived need for dental care by military recruits varies with gender, DoD dental class, region of U.S., dental utilization, and presence of extensive decay or calculus.

CONCLUSIONS

The Tri-Service Comprehensive Oral Health Survey (TSCOHS) is the first military oral health survey to be conducted on a tri-service level, the first to use a standardized protocol, the first to use an automated data collection form, and the first to collect an expansive scope of oral health information in one interconnected database. These factors combine to give the TSCOHS many unique strengths including providing a solid reference base to which future military oral health surveys may be compared to measure progress on military oral health policy objectives over time.

Successful incorporation of a full-mouth charting of dental treatment needs into our automated data collection instrument demonstrates, in part, the potential of a computer-based dental patient record (CBDPR). Unlike paper records, data in a CBDPR is readily available for detailed analysis such as time trend analysis, intensity and mix of services consumed, measurement of oral health status and outcomes, and more.

RECOMMENDATIONS

- ◆ The focus of the TSCOHS was chiefly on active duty personnel. Accordingly, because the sample size of recruits in this survey is too small for detailed analysis at the individual service level, we recommend that each service conduct a larger scale recruit survey.
- minimizing the need for data clean-up prior to analysis, the oral health survey analysis teams to complete pre-analysis ess time for the TSCOHS analysis team to complete data analysis and write this report than it took previous military recommend that future surveys capitalize on the benefits prepare a final report with unprecedented speed. It took SCOHS principle investigators to analyze this data and personnel and recruits on a periodic basis, at least use of an automated data collection form enabled the every 5 years, in order to track trends in the oral of electronic data collection as the TSCOHS did. By We recommend that a survey similar to the greatly reducing errors in data entry and thereby **ISCOHS** should be done on both active duty health of the military population. Further, we data clean-up
- We anticipate that the military dental services will eventually fully automate their dental patient records. However, until that time arrives, we recommend that to monitor the oral health of military personnel that the Tri-Service Dental Corps conduct a periodic, automated, oral health survey (PAOHS) on the military population, as follows. First, a PAOHS should be completed on every recruit or officer who enters the service. This will establish

a baseline comprehensive examination database for all incoming military personnel. Second, to capture the active duty population, a PAOHS should be incorporated as a requirement of inprocessing for every permanent change of station (PCS) move. This will establish a baseline comprehensive examination database for service members already in the service as well as provide an update database for the approximately one-quarter of service members who move each year. The update database could be used for both cross-sectional and longitudinal time trend analysis. We are likely to ensure full compliance as well as make data collection more convenient by linking the PAOHS to PCS inprocessing than by using conventional survey methods of identifying select individuals to call in for dental examinations.

whenever requested by military health policy makers. This current approach of conducting military oral health surveys would allow monitoring of oral health trends in the military rack trends in population oral health measures over time ncorporate data elements routinely collected on oral personnel could be drawn to profile the oral health of the intervals. In today's health care environment, managers When DoD develops its computer-based dental military population at a given point in time as well as to health surveys. A CBDPR incorporating oral health survey data would offer several advantages over the every 7-10 years. First, a CBDPR would establish a continually updated database from which a random, and policymakers face ever increasing demands for sopulation as events unfold, not at fixed 7-10 year patient record (CBDPR), we recommend that it epresentative, cross-sectional sample of military

current information on the health status of their catchment populations that only an automated database can reasonably provide. Second, for the first time, a CBDPR database will allow longitudinal dental studies on military personnel i.e. studies that can track oral health measures on individual service members over time. This will greatly enhance studies of outcomes assessment, enabling analysts to probe, for example, to what extent dental care provided in military dental clinics improves the oral health status of service members, the longevity of restorations placed in a patient, the intensity and mix of dental services consumed over time, and other issues.

◆ We strongly recommend that the Tri-Service

Dental Corps Chiefs create a tri-service health
services research center. There are many health
service and management information research issues
aside from those addressed in this survey that need to be
addressed by a talented research team. Because these
research issues are complex and require knowledge of
many disciplines including, but not limited to, statistics,
behavioral science, health policy, economics, law,
epidemiology, and computer programming, the center
should be staffed with individuals with advanced training
and highly developed analytical and communication skills.
Further, to ensure the efficiency and effectiveness of such
a center, continuity in assigned personnel is essential.

1. BACKGROUND AND METHODS

Background

The most recent dental treatment needs studies were completed by the Army, Navy, and Air Force in the mid-1980's. Because the timing of these surveys was not synchronized and because, at times, each service used different methods to assess oral health status and treatment needs, it is difficult to compare the results of past surveys with one another. The 1994 Tri-Service Comprehensive Oral Health Survey (TSCOHS) was undertaken to overcome this problem. Funding for TSCOHS was provided by the Office of the Assistant Secretary of Defense for Health Affairs in June 1993.

Three common perspectives for determining need for dental care are normative, perceived, and expressed.

Normative need refers to requirement for care as determined by expert opinion. Perceived need refers to the individual's self-assessment of his or her oral health status and expressed need (or demand) refers to individuals actively seeking dental care. The TSCOHS explored all three perspectives. Previous military studies of dental treatment needs have focused almost exclusively on normative need. For most of these studies, the assessment of treatment needs did not use an index but was based on the examiner's best clinical judgment. To date, all military dental needs studies have employed simple descriptive statistics to summarize their findings. None have made

use of more advanced statistical methods, such as multiple or multivariate regression to control for potential confounders. Moreover, few have been able to compare their finding to comparable civilian cohorts because results were not stratified simultaneously for age, sex, and race. Because the methods used in sampling, collecting, and analyzing data have not been consistent, it is difficult to make comparisons over time.

providing a solid reference base to which the results enable military health policymakers to assess progress providing standardized methods and simultaneous data collection for each military service. Second, it was designed to overcome comparative limitations was designed to be more comprehensive in scope results for military personnel could be compared The 1994 TSCOHS had a multifold purpose. First, it including measures of perceived and expressed with their employed, civilian cohorts. Finally, by than previous military dental health surveys by need. Third, the TSCOHS was designed so that need rather than focusing solely on normative population can be compared, the TSCOHS will of previous military dental health surveys by of future oral health surveys on the military on oral health policy objectives over time.

Survey Instruments

This cross-sectional survey of active duty personnel and recruits involved collection of quantifiable data from individual airmen, sailors, and soldiers. Oral health status, dental treatment needs, dental utilization, and perceived need for dental care are inherently quantitative data. Satisfaction with military dental care is inherently qualitative. However, we measured satisfaction using ordered categorical scales which give the data a more quantitative flavor.

Data collection was done using two forms:
a clinical exam form and a patient questionnaire. Direct data entry onto notebook computers provided "paperless" data collection and transmission. Clinical exam data was collected by calibrated dental examiners and trained recorders. The computerized satisfaction, utilization, and perceived need questionnaire was completed by each patient in the survey. There are two versions of the questionnaire. The active duty version is longer than the recruit version. Both versions explore dental utilization and perceived need for dental care. However, because recruits have not yet sought care in military dental clinics, only the active duty questionnaire probes satisfaction with military dental care.

2. Clinical Examination

then separately with radiographs. Collecting data without necessary to insure accuracy. The remaining sections of adiographs was necessary to allow valid comparisons of years old and bite-wing radiographs less than 2 years old take new radiographs, as necessary, for thorough patient the clinical exam collected data on oral health status and diagnosis using current radiographs was also required to dental classification. Panoramic radiographs less than 5 first section, patient demographic data, was collected by clinical data were recorded first without radiographs and civilian cohorts because the comparison national civilian The clinical exam form is divided into five sections. The were considered current. Examiners were instructed to the oral health status of military personnel versus their fully assess oral conditions, treatment needs, and DoD oral health survey did not use radiographs. However, reatment needs, and DoD dental classification. All freatment needs including prevalence of soft tissue conditions, caries status, clinical-discipline-specific he dental examiner, questioning the patient as

military dental care were drawn chiefly from two sources: Initiative (CRI) and the Dental Satisfaction Questionnaire Oral Health of U.S. Employed Adults and Seniors: 1985of Dental Research. Using these questions allows direct comparison between the civilian and military populations were the result of extensive development by RAND staff The patient questionnaire is a composite. Questions on recent study of adult oral health by the National Institute National Institute of Dental Research, NIH Pub. No. 87dental utilization and perceived need were drawn from RAND Corporation to evaluate the CHAMPUS Reform Experiment. We chose these questions because they health care. In addition, the CRI questions have been to evaluate the multiple components of the quality of 86; U.S. Department of Health and Human Services, a medical satisfaction questionnaire prepared by the 2868, 1987, Bethesda, MD. This survey is the most on these measures. Questions on satisfaction with (DSQ) prepared for the RAND Health Insurance field tested with a military population.

Sampling Strategy

The population of interest for this study is all active duty airmen, sailors, and soldiers in the continental United States. The sampling strategy was developed by Molajo and Associates, Consultants in the Mathematical Sciences (a civilian firm specializing in survey sampling design). Active duty personnel information was provided by the Defense Manpower Data Center. The complex sampling scheme utilized to draw the non-recruit sample

sampled using single stage, stratified, systematic random these groups. During analysis, data were weighted back breakout of the recruit sample and estimated population nterest were feasible to sample in sufficient numbers to Military recruits are predominantly white or black males. sampling. Historic data of the size and composition of determine sample size and what specific subgroups of to the proportional representation of each group in the actual recruit population. The recruit sample size was the most recent year's recruit population were used to is described in the non-recruit report. Recruits were n order to sample sufficient numbers of females and subgroups of the recruit population, we oversampled passed through the recruit training facilities of the Air month data collection period. Table (1.1) provides a allow comparisons across study outcome measures. Force, Army, Navy, and Marine Corps during the six comparisions of their outcome measures with other non-white, non-black males to allow valid statistical 2,711 which represented the 101,072 recruits that by race, gender, and age interval.

Human Subject Use

The TSCOHS protocol was reviewed by the Army Human Use Review and Regulatory Affairs Division; the Human Use Review Board, Naval Health Sciences Education and Training Command; and the Air Force Surgeon General's Clinical Investigation Committee. The protocol was found to be in full compliance with human use guidelines defined in Title 45, Code of Federal Regulations, Part 46 (Protection of Human Subjects).

6. Comparative Sample

Where possible, results from this recruit survey were compared with results from the <u>Oral Health of U.S. Employed Adults and Seniors: 1985-86</u> (NIDR, 1987). In order to make these comparisons, the data from both samples were stratified simultaneously by age interval, gender, and race. Appendix (B) displays a breakout of the employed, civilian sample and estimated population by race, gender, and age interval.

7. Definition of Major Study Variables

Key Outcome Variables

Key outcome variables include dental utilization, perceived need for dental care, satisfaction with military dental care, oral health status, and dental treatment needs. Dental utilization was determined by measuring the interval since last dental visit, as well as reason for last dental visit. Perceived need was assessed by asking patients whether they felt they needed dental care.

Satisfaction with care was determined by using a multicomponent scale modified for dentistry in the military setting. Components of overall patient satisfaction include subscales to assess the following: interaction with care providers, access to care, availability / convenience of care, pain management, quality of clinical facilities, continuity of care, quality of care, and general satisfaction. Some satisfaction items, such as dental utilization and perceived need, are in a multiple choice format. Others are measured using a five-point

Likert scale, with one representing "very satisfied" and five representing "very dissatisfied".

Assessment of oral health status involved using several indices. To measure cumulative caries experience, we used the DMF (decayed, missing, and filled) index. Both DMFT (teeth) and DMFS (surfaces) were determined. The index is a simple count of the number of decayed, missing, and filled teeth or surfaces for each patient.

Periodontal health status was assessed using the Periodontal Screening and Recording (PSR) index. The PSR combines data on periodontal probing depth, gingival bleeding, and the presence of calculus and other local factors of periodorital significance to determine the level of periodontal treatment required for individuals and populations.

A Department of Defense (DoD) dental classification was assigned to each tooth and for each clinical discipline.

Teeth were classified as class I (requiring no dental treatment), class II (requiring treatment but not expected to become a dental emergency within the next 12 months), class III (requiring treatment but likely to become a dental emergency within the next 12 months). A detailed summary of the criteria for the DoD dental classification is found in Appendix C.

In addition to these indices, we collected prevalence data on certain dental conditions that generate treatment requirements, such as oral soft tissue lesions and edentulism.

Key Explanatory Variables

Because previous studies have shown that demographic variables are strong correlates with the outcome variables mentioned above, we collected age, gender, race, and education level on every subject. In addition, branch of service, rank, type of service unit, and number of years of active duty service were collected because these variables are of potential interest to military health policymakers.

8. Measurement Error and Bias

conducted site visits during the data collection period and given calibration manuals so they could review what they performed additional calibration checks for all examiners. coefficients. To assure that consistency in measurement computerized examination instrument. Examiners were examiner participated in a three-day training/calibration acceptable level, determined through the calculation of course. During this course, data collection rules were To assure that all examinations were conducted using To minimize measurement error and bias during data exercises to become familiar with the indices and the were taught, as necessary, at a later date. Inter- and Screening and Recording) indicies and brought to an collection, prior to the start of data collection, each Cohen's kappa statistics and intraclass correlation was being maintained, the principal investigators explained and examiners participated in training intra-examiner reliability was tested on the DMF (decayed, missing, filled) and PSR (Periodontal

consistent-quality diagnostic instruments, new dental explorers, front-surface mirrors, and World Health Organization-type periodontal probes were provided to each examiner. All data were collected in military dental clinics, under similar conditions and with proper lighting.

The survey data collection instrument was field tested by the Army Research Institute for the Behavioral and Social Sciences and recommended modifications were made. To avoid imparting bias to respondents who had inquiries about the survey questionnaire, examiners were instructed to respond to such inquiries in a value-neutral way. That is, examiners were instructed that when explaining the contents of a question to a patient, they were to avoid implying that any specific answer was preferred. Instead, examiners were to counsel patients, "No single answer is correct. Just tell us what you think." Also, patients were assured that their responses were anonymous and confidential.

Use of fully computerized questionnaires for data collection provided several advantages. First, it allowed skip patterns in the questionnaire to be automated. This solved two problems commonly encountered when paper questionnaires are used. The automated questionnaire prevented respondents from getting lost and thereby failing to respond to appropriate questions as well as giving responses to inappropriate questions. Second, use of computerized questionnaires allowed us to limit response entry to legitimate values only, thereby eliminating entry of "nonsense" responses oftentimes encountered with paper questionnaires. A further

advantage of using computers for data collection was that they were programmed to use input data to immediately calculate certain summary statistics for each study participant. For example, the computer was programmed to use examination data to calculate an individual's DMFS and PSR scores and frequency counts

of specific dental procedures. Thus, an individual's data record contains raw examination and survey data, plus individual summary statistics. Later, during data analysis, individual records were combined to generate group summary statistics.

9. Data Analysis

Data were analyzed using Stata and Survey Data Analysis (SUDAAN) statistical software. Statistical significance was determined with an alpha of 0.05 for all analyses.

2. ORAL HEALTH STATUS OF MILITARY RECRUITS

Recruit Oral Health Status

The TSCOHS evaluated oral health status using the standard epidemologic measures of cumulative, lifetime caries experience - DMFI (decayed, missing and filled teeth) and DMFS (decayed, missing and filled surfaces). For DoD recruits, mean and median DMFT are 6.14 and 6 respectively; mean and median DMFS are 10.53 and 8, respectively. Figure 2.1 shows mean DMFS and the decayed, missing, and filled components for each race. Table 2.1 gives DMF scores stratified by gender and by race. The following statistically significant differences were found: Males

have lower DMF scores and higher (D) component than females; likewise blacks have lower DMF scores and higher (D) components compared to whites. Lower than average DMF scores with a higher than average (D) component are suggestive of low utilization of dental care. The race "other" (not white, black, Hispanic, or Asian), likely to be predominately Native American, have higher DMF scores compared to whites. Table 2.1 also shows that no recruits were edentulous in either the maxillary or mandibular arch.

Tables 2.2(a-c) and 2.3(a-c) provide mean decayed and filled (DF) statistics stratified by race, age group, and gender for military recruits and their civilian counterparts. Civilian statistics are taken from the <u>Oral Health of U.S. Adults and Seniors: 1985-86;</u> (NIDR, 1987). **Striking differences are apparent.** Table 2.2a shows the mean

DFS and percent (D) of DFS are 9.37 and 33.2 for recruits. These same measures are 12.92 and 15.5 for civilians when civilian data are simultaneously adjusted for age, race, and gender to the military recruit population. Figure 2.2 graphically depicts these differences for decayed and filled surfaces.

Figure 2.3 shows the percentage of military recruits by the number of missing teeth, for each race and overall. Results show 87.7% [ci ±1.2%] of recruits have no missing teeth and only 2.2% [ci ±0.6%] have more

than two missing teeth. These percentages do not include third molars. No recruit in the study sample has more than 12 missing teeth.

PERCENT DISTRIBUTION OF MISSING TEETH FOR ALL DOD RECRUITS

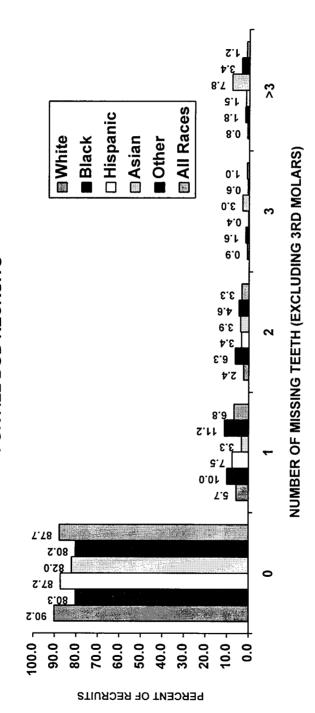

Figure 2.3

by race. Logistic regression analysis found statistically with each condition surveyed, stratified by gender and pericoronitis (4.0%), other lesion requiring referral Males are significantly more likely to present with oral tobacco lesions than females. Individuals who did not classify themselves as white, black, Hispanic, In addition to hard tissue (tooth) status, the TSCOHS significant differences between the following groups: compared with whites. This difference could not be (0.9%). Table 2.4 shows the percentage of recruits temporomandibular dysfunction (TMD), and severe prevalence for soft tissue lesions is as follows: collected subjective examiner assessments of the or Asian, i.e. "other", have significantly more oral orthodontic malocclusion. Overall the percent herpetic lesion (0.6%), tobacco lesion (1.4%) ANUG (0.3%), aphthous ulcer (2.2%), active lesions requiring referral for further evaluation prevalance of oral soft tissue lesions, severe

explained based on available survey information including gender, age, home state, and tobacco usage.

The prevalance of oro-facial pain or limited mandibular movement sufficient to require referral and/or treatment for TMD is significantly greater in females (3.5%) than in males (1.5%). Also, blacks (0.4%) require significantly less TMD referral compared to whites (2.6%).

Severe orthodontic malocclusion was defined as "severe malocclusion interfering with proper function sufficiently to require referral for orthodontic evaluation". *The prevalance of this condition is significantly greater in Asians (3.3%) compared to whites (1.2%).* No other significant differences were found based on gender, race, age, or level of education.

3. DISTRIBUTION OF DOD DENTAL CLASSIFICATION AMONG MILITARY RECRUITS

Distribution of DoD Dental Classification Among Recruits

During the examination, the overall DoD dental classification was recorded for each recruit. Figure 3.1 shows that less than one percent of all recruits are class 1 while 50.2 percent are class 2 and 49.1 percent are class 3. compared to other races, and recruits with some college or a college degree are less likely to be in dental class 3 compared to those with no college. Recruits with a college degree are more likely to be in dental Table 3.1 gives the DoD dental class stratified by gender, by race, by age category, and by education. Logistic regression analysis found the following significant differences: whites are less likely to be in dental class 3

Table 3.1

95% Confidence Interval (±%)	Interval (±%)	0.4	2.1	2.1

DoD dental classification was collected for each clinical discipline independently. Distributions of dental classification based solely on each clinical discipline are provided in later sections of this report.

To address the issue of military dental readiness, insight into the level of treatment need among DoD dental class 3 individuals is provided in Figure 3.2. The treatment level is defined as the number of clinical disciplines in which each individual has at least one DoD dental class 3 condition. More than half (58.4%) of class 3 recruits require treatment of a class 3 condition in only one clinical discipline and 92% in

one or two clinical disciplines. An individual with dental class 3 conditions in three or more clinical disciplines is considered to require complex care.

Among class 3 recruits, 8.0% require complex dental treatment. Logistic regression analysis found no significant differences in the likelihood of needing complex dental treatment based on gender, race, age or education level.

Restorative and oral surgical treatment needs are the leading causes of recruits being classified in DoD dental class 3.

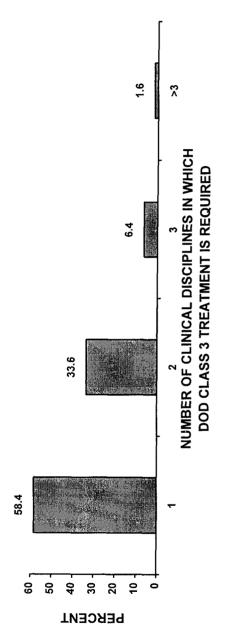

Figure 3.2

The National Institute of Dental Research divided the United States into seven geographic regions for their 1985-86 study of the Oral Health of U.S. Adults. The TSCOHS data was analyzed using identical geographic regions with one additional region (Other). The regions are defined as New England (CT, ME, MA, NH, RI, VT), Northeast (NJ, NY, PA), Midwest (IL, IN, IA, MI, MN, MO, OH, WI), Southeast (AL, AR, DE, FL, GA, KY, LA, MD, MS, NC, SC, TN, VA, DC),

Southwest (AZ, CO, NM, TX), Northwest (ID, KS, MT, NE, NV, ND, UT, WY), Pacific (CA, OR, WA), and Other (AK, HI, PR, Other). Each recruit reported his/her state of residence just prior to entering military service. Results are shown in Table 3.2. Chi-square analysis found no statistically significant differences in DoD dental classification among patients from the various geographic regions.

4. TREATMENT REQUIREMENTS EXPRESSED AS COMPOSITE TIME VALUES (CTV)

Treatment Requirements Expressed as Composite Time Values (CTV)

Figure 4.1 shows the mean and median number of CTV for each clinical discipline for all DoD recruits.

The CTV counts represent the number of CTV that would be generated when the needed treatment is delivered, including ancillary procedures.

Appendix A provides a full description of procedure codes used to calculate CTV for each type of dental treatment. The mean number of CTV of treatment required is 52.3; the median is 40.4. A relatively

small group of high-need individuals accounts for a disproportionate share of the total treatment needs for this population. Figure 4.2 gives the percentage of the total CTV of treatment need contributed by each clinical discipline. *Among recruits, oral surgical* (31.2%) and restorative (27.0%) treatment needs make up 58.2% of the total treatment required. Each discipline is discussed independently and in depth in later sections of this report.

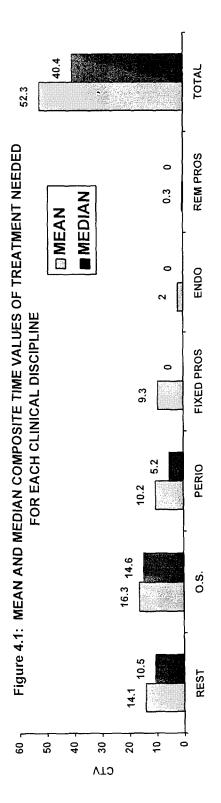

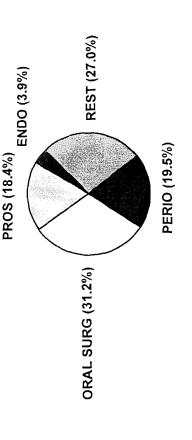

FIGURE 4.2: PERCENT OF TOTAL CTV CONTRIBUTED BY EACH CLINICAL DISCIPLINE

age; individuals with education beyond high school have less CTV of restorative and oral surgical treatment treatment need is inversely proportional to level of education; and blacks have significantly greater CTV of need increase with age in all clinical disciplines except oral surgical CTV, which decrease with increasing Table 4.1 shows the mean CTV for each clinical discipline stratified by gender, by race, by education, and by age need and greater fixed prosthodontic need compared to those with no college experience; overall CTV of category. Regression analysis demonstrated the following statistically significant differences: CTV of treatment treatment need in all clinical disciplines compared to whites.

Composite Time Values for Recruit Treatment Needs

Figure 4.3 shows the percentage of DoD recruits with total treatment needs represented by each CTV range. Over 99% of recruits require dental treatment and 20.4% require more than 75 CTV of treatment. This 20.4% of recruits accounts for 46.9% of the total CTV required by all recruits.

PERCENT OF RECRUITS BY CTV RANGE

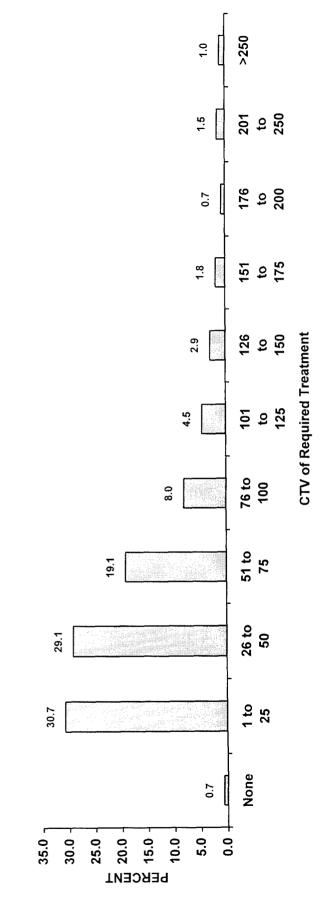

Figure 4.3

Table 4.2 gives the percentage of recruits in each CTV range stratified by gender, by race, by education, and by age category.

Figure 4.4 shows how the treatment needs of recruits in each CTV range are distributed among the clinical disciplines. Restorative, periodontal, and surgical treatment needs account for essentially all

of the CTV for those individuals in the lower CTV ranges (1 to 75 CTV). This group represents 79.4 percent of all recruits. As CTV range increases, the proportion of prosthodontic and endodontic treatment needs progressively increases.

Figure 4.4

5. RESTORATIVE TREATMENT NEEDS

Restorative Treatment Needs (RTN) and Dental Classification based on RTN

Method of Restorative Data Collection

Survey examiners assessed the health status and treatment needs of each surface of each tooth using standardized mirrors and explorers and current radiographs. Examiners used the DMFS index and associated criteria for diagnosing dental caries in this assessment.

Restorative Treatment Needs for the Total Recruit Population

Table 5.1 and Figure 5.1 details the intensity of restorative treatment needs for all DoD

recruits stratified by gender, by race, by age category, and by education level. Among all recruits, roughly one-fifth have no restorative needs while the remaining four-fifths are equally divided between needing 1-3 restorations and 4 or more restorations. Using ordered logistic regression analysis, the following groups were found to need significantly greater numbers of restorations: older persons compared to younger persons; blacks compared to whites; and non-high school graduates compared to high school graduates. Persons with college experience or a degree need significantly fewer restorations compared to high school graduates.

Types of Restorations Needed by All Recruits and by Those with Restorative Needs

4.

As shown by Figure 5.3 below and Table 5.3 on the opposite page, the majority of restorations needed are one- or two-surface types. Among all recruits, a mean of 3.52 restorations are needed per person, consisting of 1.81 one-surface restorations, 1.19 two-surface restorations, 0.39 three-surface restorations, 0.09 four-surface restorations, and 0.04 five-surface restorations. Among those who need restorative care, a similar overall

pattern prevails. The mean number of restorations required is 4.44 per person, comprising 2.28 one-surface restorations, 1.49 two-surface restorations, 0.49 three surface restorations, 0.12 four-surface restorations, and 0.06 five-surface restorations. A median of 3 restorations is needed by all recruits and the median is 4 restorations for those who need restorative care.

Recruits with restorative treatment needs split roughly half-and-half into DoD class 2 and class 3, (based only on restorative status). Logistic regression shows the following statistically significant differences in the likelihood of being in class 3 status for restorative reasons: Older recruits more likely than younger

recruits; non-black other races more likely than whites; non-high school graduates more likely than high school graduates and persons with education beyond high school less likely than those with no college experience.

estorative needs

Figure 5.5

Distribution of Number of Teeth per Person in Dental Class 3 (based only on Restorative Needs) 6

Of those persons in dental class 3 for restorative reasons, over two-thirds have just one or two class 3 teeth and nearly 90% have four or fewer class 3

teeth. The remaining 12% have from five to seventeen class 3 teeth.

This page was intentionally left blank.

7. Composite Time Values for Restorative Treatment Needs

Appendix 1 describes the assumptions used to compute CTV. Table 5.6 shows that, for all recruits, the mean CTV for restorative care is 14.1 and the median is 10.5. Figure 5.7 shows that one-fifth of recruits have no restorative treatment needs; three-fifths require between 1-25 CTV of restorative care; and the remaining one-fifth require

greater than 25 CTV of restorative care. Roughly half of all recruits require between 11-50 CTV of restorative care. Figure 5.8, illustrates that **over three-quarters of the total restorative CTV workload is concentrated in the one-third of recruits who need more than 15 CTV of restorative treatment.**

6. ORAL SURGERY TREATMENT NEEDS

Oral Surgery Treatment Needs (OSTN) and Dental Classification based on OSTN

Method of Oral Surgery Data Collection

Examiners assessed oral surgical treatment needs using standardized exam instruments and current bitewing and panoramic radiographs.

Oral Surgery Treatment Needs for the Total Recruit Population

Table 6.1 and Figure 6.1 detail the intensity of oral surgery treatment needs for all DoD recruits as well as stratified by gender, by race, by age category, and by education.

Among all recruits, about two-fifths have no oral surgery treatment needs, one-fifth need 1 or 2 teeth removed, and two-fifths need 3 or 4 teeth removed. Only 2% need more than 4 teeth removed. The mean number of teeth needing removal per person is 1.9 and the median is 1. Regression analysis shows that the following groups need significantly more teeth removed: males compared to female; younger recruits compared to older recruits; blacks and other races compared to whites; and high school graduates compared to those with some college experience.

Oral Surgery Treatment Needs Among Those Needing Oral Surgery Care

3

Table 6.2 and Figure 6.2 detail the intensity of oral surgery treatment needs among those recruits who have OS needs. Of this group, about two-fifths need one or two teeth removed, and three-fifths need 3 or

4 teeth removed. Only 3.3% need five or more teeth removed. The mean number of teeth needing removal for the entire group is 3.0 and the median is 1 tooth.

Types of Oral Surgical Procedures Needed for Persons with OS Treatment Needs

4.

Figure 6.3 and Table 6.3 show that the majority of OS procedures needed are classified as impactions. Among the recruits who need OS, the mean number of extractions needed per person is 3.1, comprising means of 0.5 simple procedures, 0.6 complex procedures, and

 2.0 impaction procedures. (Procedure classification follows guidelines described in DoD Instruction 6410.2, <u>Standardization of Code on Dental Procedures</u>, February 13, 1992).

Distribution of DoD Dental Classification Based Only on Oral Surgery Treatment Needs

5

class 2, and one-fifth are in class 3. Logistic regression analysis shows that black recruits are more likely than whites to Based only on oral surgical treatment needs, about two-fifths of all recruits are in class 1, another two-fifths are in be class 3 due to oral surgical treatment requirements.

Composite Time Values for Oral Surgery Treatment Needs

6

Appendix A shows the computation of CTV for each dental procedure. For all recruits, the mean CTV for needed oral surgery care is 16.3 and the median is 14.6. No oral surgery treatment is needed by nearly two-fifths of recruits, and another 12% need between 1 and

15 CTV of treatment. Most of these individuals need one tooth removed. The remaining 49.3% of recruits need between 15 and 70 CTV of treatment, reflecting multiple and/or more complicated surgical procedures.

7. PERIODONTAL HEALTH STATUS AND TREATMENT NEEDS

Periodontal Health Status, Treatment Needs, and DoD Dental Classification

Method of Periodonal Data Collection

Periodontal status and treatment needs were assessed using the Periodontal Screening and Recording (PSR) index, a rapid and effective way to screen patients for periodontal diseases. PSR is an adaptation of the Community Periodontal Index of Treatment Needs (CPITN), which is endorsed by the World Health Organization. PSR is recommended by The American Dental Association and The American Academy of Periodontology for all patients as an integral part of oral examinations.

Survey examiners recorded the deepest probing depth for each sextant of the dentition using the CPITN-E periodontal probe. Examiners also recorded the presence or absence of gingival bleeding and local factors (calculus/defective restoration margins) for each sextant. PSR scores were calculated electronically, based on this information.

2. Periodontal Health Status

A patient's deepest periodontal probing depth is one measure of periodontal health status. Among all DoD recruits two-thirds have no probing depth greater than 3 mm while 31.1% have at least one probing depth in the 4 to 5 mm range. *Only 2.7% of the recruits had a probing depth of 6 mm or greater.* Among all DoD recruits *88.6% have bleeding on probing and 85.6% have calculus or local factors* (Figure 7.1). Table 7.1 provides detailed information on these periodontal health status measures stratified by gender, by race, by age category, and by education. Logistic regression analysis demonstrated the following statistically significant trends:

- whites are more likely to have no probing depth greater than 3mm and less likely to have a probing depth of 6mm or greater compared to other races;
 - probing depth and the likelihood of bleeding on probing increases with increasing age;
- non-high school graduates are more likely to have a probing depth of 6mm or greater compared to individuals with a high school degree or college; bleeding on probing is more common in females,
- non-whites, and non-college recruits; - the presence of calculus/local factors is less likely in females and college graduates.

Periodontal Screening and Recording Results

რ

Figure 7.2 shows the percentage of recruits with each PSR code. Table 7.2 provides the same information stratified by gender, by race, by age category, and by education. Ordered logistic regression analysis demonstrated the following statistically significant findings: PSR scores increase with increasing age; blacks are likely to have higher PSR scores compared to whites; and college graduates are likely to have lower PSR scores compared to high school graduates. Listed below is a brief description of the periodontal therapy recommended for each PSR code.

Most therapy required by codes 0,1 and 2 can be accomplished by auxiliary dental personnel. Therapy for recruits with PSR code 3 involves direct patient contact with a general dentist. Code 4 recruits require complex periodontal treatment involving direct treatment by a periodontist. For recruits, 66.2% of needed periodontist. For recruits, 66.2% of needed auxiliary dental personnel, 31.1% of needed treatment requires direct patient contact with a general dentist, and 2.7% requires direct patient contact with a periodontist.

4. Composite Time Values for Periodontal Treatment Needs

PSR includes suggested guidelines for appropriate patient management based on individual PSR score. Following the guidance of a group of advisory military periodontists, we converted PSR treatment guidelines into dental procedure codes and composite time values (CTV). Appendix A provides the breakout of dental procedure codes for each PSR coded sextant and an explanation of the conversion to CTV. Table 7.3 gives a breakout of CTV stratified by gender, by race, by age category, and by education. Regression analysis found the following statistically significant trends: *Non-whites have more CTV of treatment need compared to whites; CTV of treatment need increase as age increases; college graduates have less CTV of*

treatment need compared to high school graduates. Table 7.3 also shows a difference between the mean (10.16) and median (5.2) number of periodontal CTV needed among all DoD recruits. This difference is due to an increase in the mean caused by a small number of individuals requiring a large amount of periodontal treatment. One half of all individuals require periodontal treatment representing 5.2 or fewer CTV. Figure 7.3 shows the percentage distribution of recruits requiring periodontal treatment by specified CTV range. While 1.2% of recruits require more than 50 periodontal CTV of treatment, and 3.7% require no periodontal treatment.

5. DoD Dental Classification Based Only on Periodontal Treatment Need

During the periodontal examination the DoD dental classification, *based only on periodontal treatment needs*, was recorded for all dentition sextants of each recruit examined. Figure 7.4 shows that *only 3.4 percent of recruits are class 1 for periodontal reasons while 92.7*

percent are class 2 and 3.9 percent are class 3. Table 7.4 gives the periodontal DoD dental classification stratified by gender, by race, by age category, and by education. Only 6.7% percent of the recruit population require a dental prophylaxis as their sole dental treatment need.

PERCENT DISTRIBUTION OF DOD DENTAL CLASSIFICATION

Percent Distribution of Periodontal DoD Dental Classification (for All DoD Recruits)

Table 7.4

Figure 7.5 shows that, *among recruits in periodontal DoD dental class* 3, a mean of 2.2 sextants are class 3, 3.3 sextants are class 2, and 0.5 are class 1. Logistic regression analysis to determine if an individual is more likely to be in periodontal DoD dental class 3 based on

gender, sex, race, age, or level of education shows that the likelihood of being in periodontal dental class 3 increases with increasing age and blacks are more likely to be periodontal dental class 3 than whites.

Among Recruits in DoD Class 3 Based Only on Periodontal Treatment Nee Mean Number of Sextants in Each Periodontal DoD Dental Class

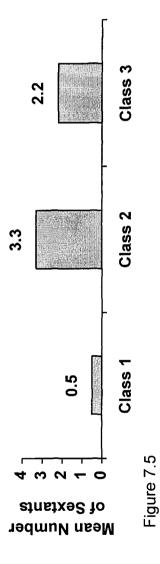

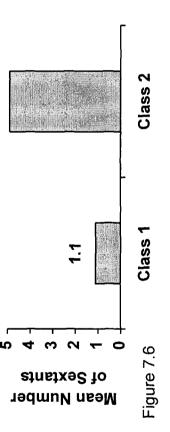

Figure 7.6 shows that among recruits in periodontal DoD dental class 2, a mean of 4.9 sextants are class 2 and 1.1 are

8. PROSTHODONTIC TREATMENT NEEDS

Prosthodontic Treatment Needs (ProsTN) and Dental Classification based on ProsTN

Method of Prosthodontic Data Collection

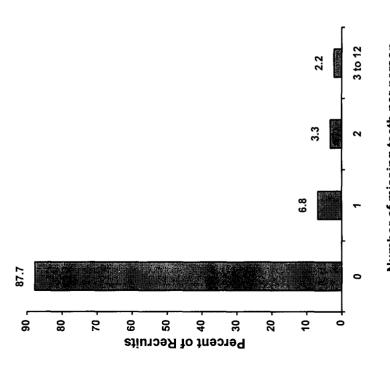

Survey examiners assessed the number of missing teeth and/or teeth requiring removal for each patient and made the determination whether to replace missing teeth using fixed or removable prostheses. Current use of partial or complete removable prostheses was assessed along with need for their replacement or repair.

Removable Prosthodontic Treatment Needs for the Total Recruit Population

Because no recruits were found to be completely edentulous or to require full-mouth extractions, *need for complete denture treatment is non-existent among recruits*. Figure 8.1 on the facing page illustrates the

number of missing teeth per person (excluding third molars) seen in the recruit population. While 87.7% of the group have no missing teeth, 6.8% have one missing tooth, 3.3% have two missing teeth, and the remaining 2.2% have from 3 to 12 missing teeth. Table 8.1 shows that 0.30% of recruits need a maxillary removable partial denture (RPD) and 0.94% need a mandibular RPD. Of those who need RPDs, about one-in-ten need both maxillary and mandibular RPDs. Logistic regression analysis found the following statistically significant differences: blacks are more likely to need an RPD compared to whites; and the likelihood of needing an RPD increases as age increases.

Intensity of Partial Edentulism among Recruits

Fixed Prosthodontic Treatment Needs for the Total Recruit Population

с,

Table 8.2 details the intensity of fixed prosthodontic (FP) treatment needs for all DoD recruits stratified by gender, by race, by age category, and by education level. Figure 8.2 (below) presents FP treatment needs for all recruits. As the figure illustrates, 80.6% of all recruits have no FP needs; 8.8% need one or two units; 8.6% need three to six units; and 2.0%

need seven or more units of FP. The mean number of fixed units needed is 0.61 and the median is 0. Ordered logistic regression analysis reveals statistically significant differences in the level of FP treatment needs as follows: older persons need more fixed units than younger persons; and blacks need more fixed units than whites

Fixed Prosthodontic Treatment Needs Among Those Needing Fixed Prosthodontic Care

Table 8.3 and Figure 8.3 detail the intensity of fixed prosthodontic (FP) treatment needs among DoD recruits who need FP care. Of the recruits needing FP care, 45.6% need one or two units, 44.1% need three to six

units, and 10.3% need seven or more units of fixed prostheses. The mean number of fixed units needed is 3.1 and the median is 3.

9. ENDODONTIC TREATMENT NEEDS

Endodontic Treatment Needs (ETN) and Dental Classification based on ETN

. Method of Endodontic Data Collection

Survey examiners assessed the potential need for endodontic therapy using radiographs and visual inspection. Definitive vitality testing for all teeth was beyond the scope of this survey. However, if the examiner believed a tooth would require endodontic care following extensive restorative procedures, it was counted as needing endodontia. (It should be remembered that a large portion of overall endodontic treatment needs likely arise over time, diagnosed as acute problems, rather than occurring passively and being diagnosed on surveys such as this).

2. Endodontic Treatment Needs - All Recruits

Table 9.1 and Figure 9.1 detail the intensity of endodontic treatment needs for all DoD recruits. *Among all recruits*, *90.8% have no current need for endodontic therapy*; 6.6% need one tooth treated endodontically; 2.6% have two or more teeth in need of endodontic therapy. The mean number of endodontia needed is 0.13, and the median is 0. Using logistic regression analysis, statistically significant differences in likelihood of needing endodontic care are as follows: older recruits are more likely than younger recruits; and blacks are more likely than whites.

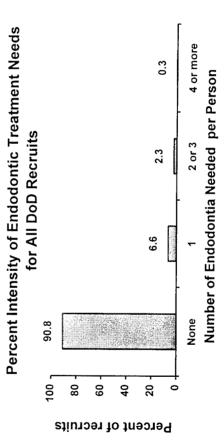

Figure 9.1

Endodontic Treatment Needs Among Those Needing Endodontic Care

ю : Table 9.2 and Figures 9.2 and 9.3 detail the intensity of endodontic treatment needs among recruits **who need endodontic care**. Of this group (9.2% of the total population), 17.2% need at least one anterior tooth treated endodontically, 17.5% need at least one premolar treated, and 73.5% need at least one molar treated. The mean number of anterior teeth requiring endodontia per person is 0.22 (indicating about 1 in 5 persons who need endodontic treatment have anterior tooth involvement).

The mean is 0.20 premolars per person (indicating about 1 in 5 people who need endodontic treatment have premolars involved). Molars are the most frequently involved teeth, with a mean of 1.00 molar involved per person who needs endodontic care. The mean number of involved teeth per person requiring endodontic care is 1.42.

Distribution of DoD Dental Classification Based Only on Endodontic Treatment Needs

4

Assuming any tooth identified as needing endodontic therapy has the potential for an acute flareup at any time, all patients with endodontic

treatment need (9.2 percent of the population) were automatically considered to be in dental class 3 status.

5. Composite Time Values for Endodontic Treatment Needs

Appendix A shows CTV calculations for dental procedures. For the entire population, the mean CTV needed for endodontic treatment is 2.0 and the median is 0. For those who have treatment need, the mean CTV required is 22.2 and the median is 16.1, which corresponds to treatment for one tooth. CTV

counts cluster relative to the number of teeth needing treatment. Figure 9.4 illustrates that 53.6% of the total endodontic CTV requirements are due to one tooth per person needing care, 24.0% of the total relate to 2 teeth per person needing care, 11.1% and 11.2% of total CTV requirements are needed for treating 3 and 4+ teeth per person, respectively.

Distribution of Endodontic CTV Clusters Corresponding to Number of Teeth to be Treated

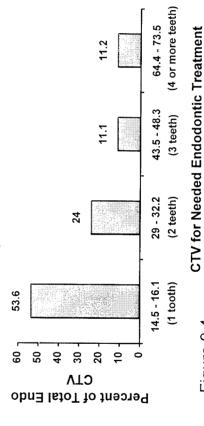

Figure 9.4

6. Distribution of Teeth Requiring Endodontic Therapy

As illustrated in Figure 9.5, the distribution of type of teeth diagnosed to need endodontic treatment is as follows: anterior - 15.4%, [\pm 3.8%]; premolar - 14.3%, [\pm 3.8%]; and molar - 70.3%, [\pm 4.0%].

Distribution of Type of Teeth Needing Endodontic Care

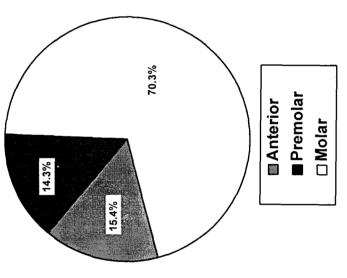

Figure 9.5

10. DENTAL UTILIZATION OF MILITARY RECRUITS

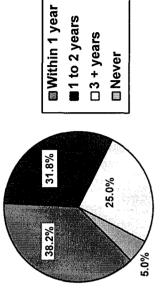

Dental Utilization of Military Recruits

Dental utilization prior to entering the service was assessed for all recruits using a self-administered questionnaire. To enable valid comparisons of recruits with their civilian cohorts, many questions were identical in wording to those used on the National Survey of Oral Health in U.S. Employed Adults and Seniors: 1985-1986 (NIDR, 1987). In all tables, point estimates are presented along with 95% confidence intervals so that statistically significant differences between any two values within the table or between tables can be readily determined. Due to variation in the size of subgroups in the sample, some estimates have wider confidence intervals than others.

Figure 10.1 and Table 10.1 show time since last dental visit for all recruits. *Only 38.2% of all recruits have* seen a dentist within the past year. Thirty percent have either never seen a dentist or have not seen one in three or more years. Table 10.1 also presents bivariate results of time since last dental visit across gender, race, age group, education level, and DoD dental fitness classification. Statistically significant differences in annual dental utilization exist between blacks versus non-blacks, 18-19 versus 20-24 year olds, non-high school graduates versus recruits with some college, DoD dental class 1 versus class 3, and DoD dental class 2 versus class 3.

Logistic regression results show the following factors significantly affect the *likelihood of having seen a dentist within the past year: being female, single, or an Air Force recruit increases the likelihood* 1.3, 1.4,

Southeastern United States, coming from the Midwest, and 1.7 times, respectively; perceiving a need for dental whites, being black decreases the likelihood 0.6 times in class 3 are 0.2 and 0.1 times, respectively, less likely dentist within the past year, and compared to recruits 3.2, 4.2, and 4.3 times, respectively; compared to 18-19 in DoD dental class 1, recruits in class 2 and recruits and having a college degree increases the likelihood year olds, 20-24 year olds and 25-29 year olds are 0.7 care decreases the likelihood 0.3 times; compared to and 0.4 times, respectively, less likely to have seen a compared to recruits without a high school degree, having a high school degree, having some college, likelihood 2.0 times; compared to coming from the while being in the non-white and non-black group predominantly Native Americans) increases the the Southwest, or the West Coast decreases the likelihood 0.8, 0.6, and 0.7 times, respectively; to have seen a dentist within the past year.

Tables 10.2-10.6 show time since last dental visit across age groups, holding gender and race constant. Where available, comparison data from the <u>National Survey of Oral Health in U.S. Employed Adults and Seniors: 1985-86</u> (NIDR, 1987) is provided. Figure 10.2 shows an <u>overall</u> comparison of dental utilization between military recruits and their civilian cohorts. This comparison is based on black and white races only because no data are available for non-black, non-white civilians. For this reason, recruit percentages in Figure 10.2 differ slightly from those given in Figure 10.1. Furthermore, overall civilian figures were adjusted to match the race, gender, and age composition

of the military recruits so that valid comparisons between the populations could be made. Adjustment was necessary because 83-94% of the estimated recruit population is between 18-24 years old, while only 35-39% of the civilian employed population falls between 18-24 years of age. Likewise, the two populations differ in racial and gender composition. **Recruits are less likely to have visited a dentist within the past year than their civilian cohorts**. Graphical presentations of the data should be viewed with caution because they exclude variances of the estimated values.

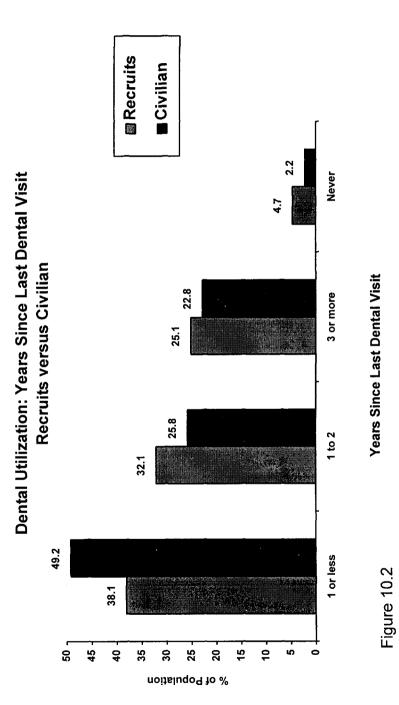

Figure 10.3 and Table 10.2 present results for white males. Across all age groups where sufficient data are available, white male recruits are less likely to have seen a dentist within the past year than their employed civilian cohorts.

civilians and 25-34 year old black male recruits. Thus, the only valid comparison between datasets in the table is for 20dentist within the past year as employed black civilians (46.6%). The data is presented graphically in Figure 10.5. The sample size for black males (Table 10.4) was insufficient to provide stable estimates for 18-19 year old black male 24 year olds. That comparison shows that black male recruits (24.2%) were nearly half as likely to have seen a

Results for black females are displayed in Table 10.5 and Figure 10.6. As with black males, insufficient data are available reveals that black female recruits (19.6%) were much less likely to have seen a dentist within the past year than Thus, the only valid comparison between black female civilians and recruits is for 20-24 year olds. That comparison to provide valid estimates for 25-34 year old black female recruits and 18-19 year old employed black female civilians. employed black female civilians (47.1%).

There is no national civilian data available on dental utilization to compare with non-white, non-black military recruits. Table 10.6 and Figure 10.7 profile dental utilization of non-white, non-black males and females. Results show no statistically significant difference between these groups.

Comparing military recruit subgroups only (i.e. comparing results between rather than within previous tables), there is no significant difference in annual dental utilization

between males and females within race for any given age group. However, there is significantly lower annual dental utilization by blacks than by whites within 20-24 year olds. Among 18-19 year olds, black males (28.6%) have lower annual dental utilization than white males (47.1%) or white females (48.4%), but there is no statistically significant difference between 18-19 year old black females (38.6%) and white males or white females.

11. Perceived Need for Dental Care

Perceived Need for Dental Care

Perceived need for dental care was assessed for all recruits using a self-administered questionnaire. To enable valid comparisons of recruits with their civilian cohorts, many questions were identical in wording to those used on the National Survey of Oral Health in U.S. Employed Adults and Seniors: 1985-1986 (NIDR, 1987). In all tables, point estimates are presented along with 95% confidence intervals so that statistically significant differences between any two values within the table or between tables can be readily determined. Due to variation in the size of subgroups in the sample, some estimates have wider confidence intervals than others.

Table 11.1 shows perceived need for dental care for all recruits as well as across gender, race, age category, education level, and DoD dental classification. Sixty-one percent of all recruits perceive a need for dental care. Statistically significant differences in perceived need for dental care exist between blacks and whites, 18-19 year olds and all other age groups, and between DoD class 2 and DoD class 3 recruits. Figure 11.1 presents a bar chart of perceived need for dental care across DoD dental classification.

Logistic regression shows that **recruits more likely to perceive a need for dental care** have the following characteristics and odds ratios (OR): **females** (OR=1.5), **from the Southwestern United States** (OR=1.7), **have calculus or overhanging restorations** (OR=1.1), **have four or more decayed teeth** (1.7), or are **in DoD dental class 3** (1.9). **Recruits who have seen a dentist in the past year are less likely to perceive a need for dental care** (OR=0.3).

Tables 11.2-11.6 show perceived need for dental care across age groups, holding gender and race constant. Where available, comparison data from the National Survey of Oral Health in U.S. Employed Adults and Seniors: 1985-86 (NIDR, 1987) is provided. Figure 11.2 shows an overall comparison of perceived need between military recruits and their civilian cohorts. This comparison is based on black and white races only because no data are available for non-black, non-white civilians. Furthermore, overall civilian figures were adjusted to match the race, gender, and age composition of the

military recruits so that valid comparisons between the populations could be made. Adjustment was necessary because 83-94% of the estimated recruit population is between 18-24 years old, while only 35-39% of the civilian employed population falls between 18-24 years of age. Likewise, the two populations differ in racial and gender composition. **Recruits are more likely to perceive a need for dental care than their civilian cohorts**. Graphical presentations of the data should be viewed with caution because they exclude variances of the estimated

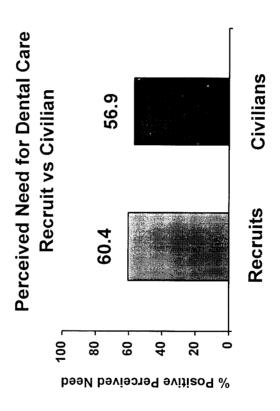

Figure 11.2

Table 11.2 and Figure 11.3 present results for white males. While 18-19 year old white male recruits are more likely, 25civilian cohorts. There is no significant difference in perceived need for dental care between recruits and employed 29 year old white males recruits are <u>less</u> likely to perceive a need for dental care than their respective employed civilians for 20-24 year olds and 30-34 year olds.

The sample size for 30-34 year old black male recruits (Table 11.4) was insufficient to provide stable estimates. Perceived need for dental care is greater among 18-19 year old employed black males than among 18-19 year old black male recruits. There is no significant difference in perceived need for dental care between recruits and employed civilians for 20-24 and 25-29 year old black males. Figure 11.5 presents the data graphically.

Comparing military recruit subgroups only (i.e. comparing results between rather than within previous tables) within race, females have significantly higher levels of perceived need for dental care than males for 25-29 year old whites, 20-24 year old blacks, and for blacks overall. Comparing across race, 18-19 and 25-29 year old black males and females have significantly greater perceived need for dental care than same age white males; 20-24 year old black females have significantly greater perceived need for dental care than similarly aged white males or females; and overall, black

females have significantly greater perceived need for dental care than white males, white females, and nonwhite, non-black males.

Tables 11.7-11.12 and Figures 11.8-11.13 display self-perceived urgency for dental care among those who perceive a need for dental care. Perceived need for immediate dental care is statistically significantly greater in DoD Class 3 recruits than in Class 1 or 2 recruits (Table 11.7 and Figure 11.8).

APPENDIX A

COMPUTATION OF COMPOSITE TIME VALUES (CTV) FOR DENTAL TREATMENT PROCEDURES

COMPOSITE TIME VALUES (CTV) ASSIGNMENT FOR DENTAL CLINICAL PROCEDURES

Military dentistry uses a <u>Standardized Code on Dental Procedures</u> which is a modification of the American Dental Association's Code on Dental Procedures and Nomenclature. The military code for dental procedures assigns Composite Time Values (CTV) for each procedure to be used for workload accountability. For every episode of dental care delivered, the care provider records a list of the treatment codes involved. This list of codes is then converted to numeric CTV.

The TSCOHS collected dental treatment requirements expressed as counts of specific dental procedures (i.e. number of two surface restorations, crowns, molars requiring endodontic treatment, patients in each PSR code, etc.). In order to address the total workload of treatment needs and to make comparisons across clinical disciplines possible, raw

counts of dental treatment procedures were converted into CTV.

discipline were asked to provide a list of the dental required dental treatments into composite time values. for patient examination, rubber dam, local anesthesia, This approach guards against artificial inflation of restoration it is customary to record procedure codes routinely a part of each specific dental treatment. provide a detailed description of the calculations and occasionally taken and list only those which are example, when treating a patient with an amalgam CTV counts. The following pages of this section and patient handling time. The specialists were delivering each specific dental treatment. For asked to exclude procedure codes which are Consulting specialists in each clinical procedure codes they normally record when assumptions used in the process of converting

CTV ASSIGNMENT FOR RESTORATIVE CARE AND SEALANTS

ADD ON PROCEDURES FOR RESTORATIVE CARE

0.4	1.4	0.4	1.0
0130 - other examination	9973 - patient handling (tx)	2960 - rubber dam	9211 - local anesthesia

TOTAL (for each rest. procedure)

3.2/1.3 restorations per appointment = 2.5

TOTAL PROCEDURES FOR RESTORATIVE CARE

One surface restoration

$$2140$$
 - one surface amalgam 1.0 plus $2.5 = 3.5$

Two surface restoration

1.9 plus
$$2.5 = 4.4$$

Three surface restoration

$$2.2 \text{ plus } 2.5 = 4.7$$

Four or more surface restoration

$$2.6 \text{ plus } 2.5 = 5.1$$

than for a single surface amalgam (1.0). However, the CTV for a two surface resin (1.4) is less than for a two Note: CTV for amalgam restorations were used. The CTV for a single surface resin plus etch (1.4) is greater surface amalgam (1.9). Also, three surface resin plus etch (2.1) and three surface amalgam restorations (2.2) required. Assuming all restorations to be amalgam should not cause significant error in the operative CTV have essentially the same CTV. The TSCOHS data base does not indicate the type of restorative material

PROCEDURES FOR SEALANTS

0.4	1.4	1.8
0130 - other examination	9973 - patient handling (tx)	subtotal for sealants

(assume four sealants placed per appointment) 1.8/4 = 0.45

$$0.3 + 0.45 = 0.75$$

CTV ASSIGNMENT FOR ORAL SURGERY (EXTRACTIONS)

SIMPLE EXTRACTION

7110 - simple tooth removal	0.7

CTV ASSIGNMENT FOR PERIODONTAL SCREENING AND RECORDING CODES

Following the guidance of a group of consulted military periodontists, PSR treatment guidelines were the World Health Organization. PSR is recommended by The American Dental Association and The adaptation of the Community Periodontal Index of Treatment Needs (CPITN), which is endorsed by converted to dental procedure codes and composite time values (CTV). The following provides the includes suggested guidelines for appropriate patient management based on individual PSR score. Recording (PSR) a rapid and effective way to screen patients for periodontal diseases. PSR is an Periodontal status and treatment requirements were assessed using Periodontal Screening and American Academy of Periodontology for all patients as an integral part of oral examinations. breakout of dental procedure codes taken when treating each PSR coded sextant and an explanation of the conversion to CTV.

de 1: Oral hygiene instructionCoronal polishTopical fluoride application

Scaling by oral prophylaxis technician or registered dental hygienist Oral hygiene instruction Coronal polish Code 2:

Topical fluoride application

Scaling, and root planing as indicated, with anesthetic by RDH or a dental officer Vertical bitewing and selected periapical radiographic survey Comprehensive periodontal examination by a dental officer Oral hygiene instruction Coronal polish Code 3:

Coronal polish
Topical fluoride application
Post-hygiene reevaluation by a dental officer.

Comprehensive periodontal examination by a dental officer

Vertical bitewing and selected periapical radiographic survey

Oral hygiene instruction

Scaling, and root planing as indicated, with anesthetic by RDH or a dental officer

Coronal polish

Topical fluoride application

Post-hygiene reevaluation by a dental officer

Periodontal Surgery to include: a) blood pressure recording

b) anesthetic

c) mucogingival flaps

d) root planing

e) prescription medications

f) adjunctive surgical procedures

Postoperative Treatment at 1, 2, and 4 weeks.

Included in this scheme are the conservative assumptions that:

-Two sextants can receive either root planing or surgery during the same appointment.

-No surgical therapy will be required for code 3 sextants.

-Osseous surgery, osseous grafting, guided tissue regeneration, or distal/mesial wedge will be required in only one-half of code 4 sextants.

- Complete (7.2) or limited (0.7) occlusal adjustment, and antimicrobial therapy have not been factored into these estimates.
- The requirement for supportive periodontal therapy is not included in the algorithm.

Estimated Comprehensive Periodontal Treatment Based on Whole Mouth PSR

1) Given a dentition with all six sextants PSR code 1, the following dental treatment is required: Oral hygiene instruction, coronal polish, topical fluoride application.

Dental Procedure Codes	
0130- other examination	0.4
1330- oral hygiene inst.	0.3
1110- adult prophylaxis	1.8
1240- topical fluoride tx	0.7
9973- patient handling (tx)	1.4
Total CTV	4.6

CTV per Code 1 sextant = 4.6/6 = 0.8

2) Given a dentition with all six sextants PSR code 2, the following dental treatment is required:

Oral hygiene instruction, coronal polish, topical fluoride application, scaling by hygienist.

Dental Procedure Codes	
0130- other examination	0.4
1330- oral hygiene inst.	0.3
4342- periodontal scaling x 6	2.4
1110- adult prophylaxis	1.8
1240- topical fluoride tx	0.7
9973- patient handling (tx)	1.4
Total CTV	7.0

CTV per Code 2 sextant = 7.0/6 = 1.2

3) Given a dentition with all six sextants PSR code 3, the following dental treatment is required:

periapical radiographs, vertical bitewing radiographs, scaling and root planing (4 settings, root plane x 6), Oral hygiene instruction, coronal polish, topical fluoride application, type 2 exam by specialist, selected local anesthetic.

Dental Procedure Codes

0130- other examination x 4	1.6
0140- comprehensive exam x 2	7.2
0210- intraoral series of radiographs	2.8
1330- oral hygiene inst. x 6	1.8
4343- scaling and root planing x 6	8.4
1110- adult prophylaxis	1.8
1240- topical fluoride tx	0.7
9211- local anesthesia x 4	4.0
9972- patient handling (dx) x 2	2.0
9973- patient handling (tx) x 4	5.6
Total CTV	35.9

CTV per Code 3 sextant = 35.9/6 = 6.0

4) Given a dentition with all six sextants PSR code 4, the following dental treatment is required:

local anesthetic, post-hygiene reevaluation by specialist, six sextants of periodontal surgery at four settings, periapical radiographs, vertical bitewing radiographs, scaling and root planing (4 settings, root plane x 6), Oral hygiene instruction, coronal polish, topical fluoride application, type 2 exam by specialist, selected final scaling and root planing (4 sittings, root plane x 6).

Dental Procedure Codes

														110.2 + 15 (surgery supplement 2.5 x 6) = 125.2
5.6	7.2	1.6	2.8	4.8	31.2	19.2	1.8	0.7	8.0	1.2	4.5	2.0	19.6	110.2
0130- other examination x 14	0140- comprehensive exam x 2	0160- blood pressure x 8	0210- intraoral series of radiographs	1330- oral hygiene inst. x 16	4250- mucogingival flap x 12	4343- scaling and root planing x 12	1110- adult prophylaxis	1240- topical fluoride tx	9211- local anesthesia x 8	9631- prescription x 4	9918- postoperative treatment x 9	9972- patient handling (dx) x 2	9973- patient handling (tx) x 14	Total CTV

CTV per Code 4 sextant = 125.2/6 = 20.9

required in only one half of code 4 sextants. Therefore count 5.1/2 = 2.5 CTV (surgery supplement) for each Osseous surgery, osseous grafting, guided tissue regeneration, or distal/mesial wedge techniques will be code 4 sextant.

Surgery supplement 4260- osseous resective surgery 1.4 4261- osseous graft 1.5 4268- guided tissue regeneration 1.5 4230- mesial/distal wedge 7.7 Total

DOD DENTAL CLASSIFICATION CRITERIA APPENDIX C

DOD DENTAL CLASSIFICATION CRITERIA

Source: DoD Instruction 6410.1, Standardization of Dental Classifications

not requiring dental treatment or reevaluation within 12 months. CLASS 1

- A. No dental caries or defective restorations
- 3. Arrested caries for which treatment is not indicated
- Healthy periodontium, no bleeding on probing, oral prophylaxis not indicated ပ
- D. Replacement of missing teeth not indicated
- Unerupted, partially erupted, or malposed teeth that are without historical, clinical, or radiographic signs or symptoms of pathosis and are not recommended for prophylactic removal
- F. Absence of temporomandibular disorder; stable occlusion

conditions present which, if not treated or followed up, are not expected to, but have the potential to result in dental emergencies within 12 months. CLASS 2:

- Treatment or followup indicated for dental caries with minimal extension into dentin or minor defective restorations easily maintained by the patient where the condition does not cause definitive symptoms Ä
- Interim restorations or prostheses that can be maintained by the patient where the underlying condition does not cause definitive symptoms. (This includes teeth that have been restored with permanent restorative materials, but for which protective coverage is indicated). Θ.
- Edentulous areas requiring prostheses but not on an immediate basis ပ
- D. Periodontal disease or peridontium exhibiting:
- (1) Requirement for oral prophylaxis
- Requirement for maintenance therapy; this includes stable or non-progressive mucogingival conditions requiring periodic evaluation (5)
- (3) Non-specific gingivitis
- (4) Early or mild adult periodontitis
- (5) Supragingival or slight subgingival calculus

CLASS 2: (Cont.)

- E. Unerupted, partially erupted, or malposed teeth that are without historical, clinical, or radiographic signs or symptoms of pathosis, but which are recommended for prophylactic removal
- . Active orthodontic treatment
- G. Temporomandibular disorder patients in maintenance therapy

oral conditions which, if not treated, are expected to result in dental emergencies within 12 months. When there are questions in determining classification between Class 2 and Class 3, patient should be placed in CLASS 3:

- dentinoenamel junction and causes definitive symptoms; dental caries with moderate or advanced Dental caries, tooth fractures, or defective restorations where the condition extends beyond the extension into dentin; and defective restorations not maintained by the patient. Ä
- Interim restorations or prostheses that cannot be maintained for a 12-month period. (This includes teeth that have been restored with permanent restorative materials but for which protective coverage is œ.
- C. Periodontal diseases or periodontium exhibiting:
-) Acute gingivitis or pericoronitis
- 2) Active moderate to advanced periodontitis
- 3) Periodontal abscess
- 4) Progressive mucogingival condition
- Periodontal manifestations of systemic disease or hormonal disturbances (2)
- (6) Moderate to heavy subgingival calculus
- Edentulous areas or teeth requiring immediate prothodontic treatment for adequate mastication, communication, or acceptable esthetics Ö.
- Unerupted, partially erupted, or malposed teeth with historical, clinical, or radiographic signs or symptoms of pathosis, that are recommended for removal ш

CLASS 3: (Cont)

- F. Chronic oral infections or other pathologic lesions including:
- (1) Pulpal or periapical pathology requiring treatment
- (2) Lesions requiring biopsy or awaiting biopsy report
- G. Emergency situations requiring therapy to relieve pain, treat trauma, treat acute oral infections, or provide timely follow-up care (e.g., drain or suture removal) until resolved
 - H. Temporomandibular disorder requiring active treatment
